

FNB Sales Analysis Project

Project Overview

The FNB Sales Analysis Project is a data analytics project focused on analysing sales data to identify sales trends, customer purchasing patterns, product performance, and overall business performance.

The project demonstrates how raw sales data can be cleaned, transformed, analysed, and presented through meaningful metrics and visualisations to support data-driven business decisions.

Project Objectives

The main objectives of the project are to:

- Analyse overall sales performance.
- Identify sales trends over time.
- Determine the best- and worst-performing products.
- Analyse sales by product category.
- Examine customer purchasing behaviour.
- Identify patterns in sales volume and revenue.
- Calculate important sales and profitability metrics.
- Create dashboards and visualisations to communicate insights.
- Provide data-driven recommendations for improving business performance.

Data Analysis Process

The project follows a typical data analytics workflow:

1. **Data Collection** – Import and inspect the FNB sales dataset.
2. **Data Cleaning** – Identify and handle missing values, duplicates, incorrect data types, and inconsistent values.
3. **Data Transformation** – Create calculated fields and useful categories for analysis.
4. **Exploratory Data Analysis** – Investigate sales, products, customers, and trends.
5. **Metric Development** – Calculate key performance indicators such as sales, quantity sold, average sales, and profitability.
6. **Data Visualisation** – Build charts and dashboards to communicate the findings.
7. **Business Insights** – Interpret the results and identify important patterns.
8. **Recommendations** – Suggest potential actions based on the analysis.

Key Questions

The analysis focuses on questions such as:

- What are the overall sales and revenue levels?
- Which products generate the most sales?
- Which product categories perform best?
- How do sales change over time?
- What are the busiest sales periods?
- Which products have low sales performance?
- What factors appear to influence sales?
- Where are opportunities for improving sales performance?

Tools and Technologies

The project can demonstrate skills in:

- **SQL** – Data cleaning, transformation, aggregation, and analysis.
- **Databricks** – Data processing and SQL analysis.
- **Excel** – Pivot tables, calculations, and dashboards.
- **Power BI / Looker Studio** – Interactive data visualisation.
- **GitHub** – Version control and project documentation.

Project Outcome

The final outcome is a structured sales analysis that transforms raw FNB sales data into useful business insights. The project demonstrates the ability to move from raw data through data cleaning and analysis to visualisation and business recommendations.

This project forms part of my **Data Analytics Portfolio** and demonstrates practical skills in SQL, data preparation, exploratory analysis, data visualisation, and business intelligence.
